

WORK EXPERIENCE

- Software Development Manager, Standard Chartered GBS, Bangalore

Apr 2025 - Present

 - Promoted to lead BCBS Self-Assessment Plugin — a regulatory ticketing and audit platform for Basel-aligned bank-wide self-assessment workflows. Delivered net-new application end-to-end in 9 months (Jul 2025 – Apr 2026) with a 4-engineer team, serving 200K+ global users (employees + external clients) with ~20K concurrent at quarter/year-end peaks; remained hands-on across architecture, backend, and frontend.
 - Chose **Quarkus over Spring Boot** for the backend to leverage faster JVM startup, lower memory footprint, and tighter Kubernetes/container fit — better suited to elastic horizontal scaling for spiky quarter-end load; stack: **Quarkus, GraphQL, LitJS Web Components, Oracle PL/SQL**.
 - Proposed and drove adoption of a **lightweight form model** replacing the bank's incumbent heavyweight drag-and-drop Form Designer for this app reducing form-render overhead and DB pressure during peak windows.
 - Designed bespoke **Java workflow engine** for hierarchical multi-stakeholder approval flows with delegation and audit; architected for peak load via **multi-threading, Oracle table partitioning, and read replicas**, load-tested to 20K concurrent; drove security and code-quality remediation across BCBS and inherited modules.
- Senior Software Engineer, Standard Chartered GBS, Bangalore

Apr 2023 - Mar 2025

 - Decomposed legacy PHP/Java scheduler-driven monolith into **22 Java Spring Boot microservices** communicating via **Solace MQ, REST, and WebSockets**; re-platformed cron-triggered ETL into chunked in-application Java processing, eliminating overnight service degradation and enabling near-real-time cross-cluster/team data sync.
 - Built **bank-wide Elasticsearch search platform** over legacy risk/transaction data; modeled **18 wide relational tables (hundreds of columns, millions of rows)** into denormalized search documents, with **Spring Batch + ES bulk indexing** for initial load, **ES sink connectors** for ongoing sync, and Java search APIs powering UI queries.
 - Designed in-house **Java secrets management system** replacing manual Rundeck key distribution; implemented OAuth2-style flow exchanging app-issued user credentials for short-lived **client ID/secret pairs** and runtime encrypted resource credentials, eliminating standing secrets on disk across DB/OUUD/LDAP etc access.
 - Built **visual drag-and-drop Workflow Designer** (Java Spring Boot) with stage-and-transition model and **form-to-workflow mapping engine** binding form action buttons to workflow transitions via action-field matching; integrated with prior-role Form Designer and incident tracking module.
 - Built **multi-threaded concurrent report-extraction service** (Java) for downloading reports of millions of records over complex aggregation queries — indexed batched pulls, per-thread chunked writes, ordered coalescing — significantly reducing DB load and latency; same engine powers **20GB+ daily Hadoop dumps and incremental change-only file syncs**.
 - Tech-led multiple parallel initiatives above; served as engineering point of contact alongside platform VP for **external technical audit**, walking auditors through architecture and closing all findings. **Promoted to Development Manager, April 2025.**
- Software Developer, Standard Chartered GBS, Bangalore

Jul 2021 - Mar 2023

 - Built **Trade Confirmation platform** end-to-end (Java Spring Boot, ReactJS, PostgreSQL) for executing and auditing live-market trades across metals, bonds, and large equity transfers; integrated real-time market rates via **Solace pub/sub and Spring WebSockets**. Delivered to SIT in 8 weeks and production in 12 with a 4-dev team, **processing 10K+ daily trades** and replacing manual and third-party execution flows.
 - Architected and built backend for in-house **drag-and-drop Form Designer** (Java Spring Boot, PL/SQL) with dynamic schema-to-DB mapping, form save/publish lifecycle, and runtime rendering — enabling non-technical users to create and deploy forms without developer involvement; **decommissioned third-party tool, avoiding \$1.2M+ in licensing and feature costs**.
 - Integrated **real-time FX market data feed** into core banking application via **Solace MQ event-driven pipeline** (Java Spring Boot, PL/SQL), replacing scheduled batch ingestion; enabled downstream trading and risk modules to consume live exchange rates with sub-second freshness.
- Software Development Intern, Standard Chartered GBS, Bangalore

May 2020 - Jul 2020

 - **Developed an internal employee skill evaluation platform** using Django and REST APIs, enabling staff to assess, track, and certify skills while providing managers real-time dashboards for performance monitoring and evaluation assignments.

EDUCATION

- National Institute of Technology Karnataka, Surathkal, India

Bachelor of Technology
- Aug 2017 - May 2021

GPA: 8.19/10.0

SKILLS

Languages:	Java, JavaScript, Python, SQL
Backend:	Spring Boot, Quarkus, GraphQL, Flask
Frontend:	LitJS
Databases:	Oracle PL/SQL, PostgreSQL
DevOps:	Git, Maven, Jira
Architecture:	Microservices, Distributed systems, System design, Agile
